# WEEKLY HEALTH REPORT

## NATURE OF THE DATA

The data presented here are taken from the Statistical Health Reports, Form 86ab, rendered weekly to the Office of The Surgeon General by every hospital and separate dispensary in the continental United States. Troops in transit and certain small detachments are not required to submit reports; for this and other reasons, total strength of reporting units has been consistently about 1 percent below the actual strength of the Army in this country. The mean strength shown for individual stations is that of Army personnel attached or assigned for medical care and does not include organizations not on the post but dependent on the station for hospitalization.

Because of the desirability of placing the information in circulation at the earliest possible time following its receipt, figures are in general shown herein as reported. Where there is some doubt as to the accuracy of the reported figures, their verification is requested, and the fact that they have been so questioned is indicated by the symbol (!).

### MORBIDITY DATA

Admissions are reported only for cases admitted to a medical installation (either to hospital or quarters) and not returned to duty within the same day, except for certain cases carded for record only (chiefly venereal disease cases treated on duty status, and deaths which occurred before admission to hospital or quarters). Admissions designated as "injury" comprise all "new" traumatisms (i.e., morbid conditions due to external causes, including poisons taken internally, results of exposure to heat, cold and light, as well as various types of wounds not due to enemy action) other than battle casualties. Under present conditions there would not be any direct admissions in the continental United States properly classifiable as battle casualties. All cases other than those of injury or battle casualty are classified as "disease."

Admission rates are shown for all causes combined, for all diseases combined, for injuries and for a few specific diseases. These rates are presented on an annual basis to facilitate comparisons with corresponding rates in annual and monthly reports. Such annual rates of admission indicate the number of admissions per thousand mean strength which would occur over a year's time if the current week's experience continued for a year.

The report also shows the number of cases of the more common communicable and certain other diseases of special interest. It may be noted that under the term infectious hepatitis are included cases reported as jaundice and cholangitis. Appended is a list of cases reported for the rarer communicable and certain other diseases.

The average proportion of the daily strength of the command which is confined to hospital or quarters (mean number of non-effectives per thousand strength) is given in the summary table for the total United States and for each of the Service Commands. More significant is the estimated non-effective rate for personnel stationed in the United States shown in the chart on page 7.

The number of enlisted men discharged during the week on Certificates of Disability for Discharge (CDD) are shown for individual stations. These data should be distinguished from the figures for "honorable discharges for physical and mental disqualification" assembled by The Adjutant General's Office; the latter include discharges for inaptness in addition to CDD's and are tabulated on a somewhat different basis (e.g., the April data represent April discharges processed by the AGO during April and May plus discharges prior to April which were processed in May).

In making comparisons between Service Commands it should be borne in mind that morbidity rates naturally tend to be higher in those Service Commands which have a relatively large number of General Hospitals and Ports of Embarkation. The presence of sizeable numbers of troops not under the jurisdiction of a Service Command (e.g. casualties, task force troops, etc.) affects the interpretation of the data from the viewpoint of Command responsibility.

### MORTALITY DATA

Recent studies indicate that the reporting of deaths on Forms 86ab is incomplete, especially in the case of deaths from injury. The resulting understatement in the mortality rate from injury may be as much as 15 percent and occasionally even more, but the death rate from disease is not materially understated. Therefore in computing mortality rates from injury and from all causes on the basis of the corresponding numbers of deaths, as shown in this report, an appropriate adjustment for the underreporting of such deaths must be made.

### STATIONS WITH HIGHEST MORBIDITY RATES

Included in the report is a table listing the stations (having strength of 5000 or over) with the highest morbidity rates from all causes, from all diseases combined, from injuries, and from a few specific diseases. Not infrequently, the excessively high rates of admission for all causes and for all diseases combined reported from reception centers reflect a large number of venereal disease cases among newly inducted men. Therefore, more significant of high morbidity from disease are the rates of admission for disease excluding venereal infections existing prior to induction, which rates are also shown in the table. It should also be noted that reception, redistribution, and separation centers frequently report relatively large numbers of admissions arising from routine physical examinations of large bodies of troops.

### EXPLANATORY MATTER

In reading the detail tables, it should be born in mind that admission rates based on small numbers of cases are not reliable. For this reason the symbol (?) is placed after admission rates computed on the basis of 5 or fewer cases.

Where the current week's data for a particular station have not been received, the latest available figures are substituted therefor and the symbol (#) is placed after the name of the station.

## COMMENT ON CURRENT TRENDS

### CURRENT MORBIDITY IN THE CONTINENTAL UNITED STATES

#### All Causes: Disease and Injury:

Morbidity from all causes decreased slightly (by 3 percent) during the week ending 29 June, being reported at 550 per year per thousand strength. The current week's admission rate is about 5 percent higher than that for the corresponding week of 1944. Morbidity from disease also decreased, being reported at 497 per thousand.

The admission rate from injury increased to 53 per thousand. It should be borne in mind that the injury rates reported since October 1944 are not strictly comparable with those prior to that time because of the directive (issued 29 September 1944) which provided for the reporting of injuries existing prior to entry into active service and of readmissions for injury under "disease" rather than under "injury," as was formerly done.

#### Respiratory Causes:

Morbidity from colds, influenza, etc. was reported at 92 per thousand, or about 1 percent lower than the previous week, and the lowest rate recorded since November 1944. The current week's rate is about 40 percent higher than that for the corresponding week of 1944.

The admission rate for pneumonia decreased slightly to 9 per thousand which is 50 percent above the rate reported for the corresponding week of 1944.

#### Common Communicable Diseases:

Morbidity from venereal disease, excluding cases contracted prior to entry on active service decreased slightly to 45 per thousand which is nonetheless relatively high. This reflects in part the

normal cyclical trend during the month since the lowest rate usually occurs during the first week, followed by a steady rise thereafter until the end of the month. The current week's rate is higher than the highest rate reported during any week of 1944.

The admission rate from diarrhea and dysentery remained at 7 per thousand, continuing the low level experienced so far this year.

The number of new cases of infectious hepatitis decreased to number 189 which is almost the highest so far this year.

#### VARIATION IN MORBIDITY BY SERVICE COMMAND

#### All Causes: Disease and Injury:

The admission rate from disease decreased in all Service Commands except the First, Sixth, and Eighth; only in the Sixth did other than a small increase occur. Decreases of 10 percent or more were registered in the Second Service Command and MDW.

The Eighth and Ninth Service Commands reported the highest morbidity from all causes (about 575 per thousand) and from disease (about 520 per thousand). The lowest admission rates from all causes (468 per thousand) and from disease (434 per thousand) was reported by the MDW, followed by the Second and Seventh Service Commands.

The Eighth and Fourth Service Commands reported the highest morbidity from injury (about 65 per thousand). The Seventh Service Command had a relatively high rate because of a tornado at Liberal AAF, Kansas. All other Commands reported rates of under 50 per thousand.

## COMMENT ON CURRENT TRENDS (CONT'D)

Respiratory Causes:

Morbidity from colds, influenza, etc. fluctuated widely as between Service Commands. Decreases of over 20 percent were registered in the Second, Third, and Ninth Service Commands and MDW, while increases of 10 percent or more were reported by the Fourth and Eighth Service Commands. The highest morbidity from these causes was reported by the Seventh Service Command (121 per thousand), while the lowest was registered by the Second and Third Service Commands (about 60 per thousand). All Service Commands except the Sixth, Seventh, Eighth and Ninth had rates under 100 per thousand.

The admission rate from pneumonia remained about the same in most Service Commands. The Eighth Service Command reported the highest morbidity from this cause (15 per thousand).

Common Communicable Diseases:

Morbidity from venereal diseases, excluding EPTS cases remained about the same in most Service Commands. The sharpest increase (30 percent) was reported by the First Service Command, while only the Second Service Command registered a decrease of over 15 percent. The highest morbidity from these causes was in the Fifth Service Command (55 per thousand), followed closely by the Third Service Command.

Exceptionally low morbidity from diarrhea and dysentery was reported in every Service Command, with only the Fourth reporting a rate in excess of 10 per thousand. The number of new cases of infectious hepatitis increased sharply in the Second Service Command (at Rhoads G. H.).

NON-EFFECTIVE RATE:

The non-effective rate for personnel stationed in the continental United States is estimated at 28.9 per thousand strength for the week ending 29 June as compared with approximately 29 per thousand for the corresponding week of 1944. The mean number of non-effectives in this country, including evacuees from overseas, decreased to 100.6 per thousand, which is the first time in more than a year that a decline occurred.

PATIENTS REMAINING UNDER TREATMENT: 29 JUNE 1945:

The number of neuropsychiatric cases remaining was 37,252 or about 400 less than at the end of the previous week. Non-battle injury patients remaining numbered 53,100. The number of battle casualty patients remaining increased by about 3,700 to number 111,279.

CERTIFICATES OF DISABILITY FOR DISCHARGE:

During the week ending 29 June there were 7,486 enlisted personnel discharged by CDD or about 50 more than the previous week. About 41 percent of these discharges were reported by General Hospitals and 35 percent by Convalescent Hospitals. Included among the 7,486 CDD's were 2,674 neuropsychiatric cases.
